

React Environment Setup

- Installing Node.js & npm
- Creating a New React Project

Step 1: Install Node.js & npm

1. Download and Install Node.js:

- Go to the [Node.js](https://nodejs.org/) website.
- Download the latest version of Node.js for your operating system.

2. Verify Installation

- Open your terminal (Command Prompt, PowerShell, or any terminal emulator).
- Check the Node.js and npm versions by running following command :

```
node -v  
npm -v
```

Why node.js and npm ?

- **Node.js** : Provides a runtime environment for executing JavaScript code outside of a browser. It is essential for running development tools like **Create React App**.
- **npm (Node Package Manager)** : Helps manage packages (libraries and tools) required for React development. It's bundled with Node.js.

Step 2: Set Up a New React Project

1. Create a Project Folder

- Navigate to the directory where you want to create your React app.
- Open a cmd terminal
- Create a new folder : `mkdir my-react-app`
- Navigate into the folder : `cd my-react-app`

2. Initialize a New React Project

- Run the following command in your terminal : `npx create-react-app`
- This will set up a new React project in the current directory.

3. Verify the Setup

- After the setup is complete, navigate into your project directory (if not already there).
- Start the development server: `npm start`
- Open your browser and go to <http://localhost:3000>. You should see the default React app page.

Congratulations ! You have created your first React app
