

Java

Data Types in Java :-

- Defines the type of data a variable can hold.
- There are two types of Data Type i.e. Primitive Data Types & Non-Primitive Data Types.

2. Non – Primitive Data Type :-

- Non-Primitive Data Type is also called Reference Data Types.
- They are created by the programmer, not defined by Java language.

1) String –

- A non-primitive data type that represents a sequence of characters.
- In Java, String is a class in java.lang package.
- Strings are immutable (once created, cannot be changed).

Syntax -

String variableName = "value"; // Using String literal

String variableName = new String("value"); // Using new keyword

Example –

```
public class StringExample {  
    public static void main(String[] args)
```

```
{  
    String s1 = "Hello";  
    String s2 = new String("World");  
  
    System.out.println("String 1: " + s1);  
    System.out.println("String 2: " + s2);  
    System.out.println("Length of s1: " + s1.length());  
    System.out.println("Concatenation: " + s1 + " " + s2);  
    System.out.println("Uppercase: " + s1.toUpperCase());  
    System.out.println("Equals: " + s1.equals("Hello"));  
}  
}
```

Output –

String 1: Hello

String 2: World

Length of s1: 5

Concatenation: Hello World

Uppercase: HELLO

Equals: true

Scanner Class in Java :-

1. Scanner Class - Used to take input from the user.
2. Package - java.util.Scanner.

Syntax to create object -

Common Methods -

- `nextInt()` - reads integer
- `nextDouble()` - reads double
- `next()` - reads a single word
- `nextLine()` - reads a full line

Example –

```
package assignment;
```

```
import java.util.Scanner;
```

```
public class arithmetic_task {  
    public static void main(String [] args)  
    {  
        int num1,num2;  
        Scanner s=new Scanner(System.in);
```

```
        System.out.println("Enter First Number:");
        num1=s.nextInt();

        System.out.println("Enter Second Number:");
        num2=s.nextInt();

        System.out.println("Addition is:"+(num1+num2));
        System.out.println("Substraction is:"+(num1-num2));
        System.out.println("Multiplication is:"+(num1*num2));
        System.out.println("Division is:"+(num1/num2));
        System.out.println("Modulus is:"+(num1%num2));
    }
}
```

Output –

Enter First Number:

8

Enter Second Number:

4

Addition is:12

Substraction is:4

Multiplication is:32

Division is:2

Modulus is:0
